	3.2	Add your plugin to the OpenBiblio menu	2			

OpenBiblio has a very flexible plugin system. This document will describe how you can enable and disable plugins, understand the plugins that are included with OpenBiblio, and design a new plugin.

1 Enabling plugins

Tip

You will need access to the Tools menu.

- 1. Go to Tools \rightarrow Plugin Manager.
- 2. Make sure that Plugins are Allowed.
- 3. Check the box next to each plugin you are interested in using.

2 Plugins bundled with OpenBiblio

These plugins all come bundled with a default OpenBiblio installation.

3 Creating a new plugin

This requires basic PHP skills and access to the files.

3.1 Design the plugin

1. Create a new directory that begins with the word plugin, followed by an underscore, followed by the name of your plugin. In UNIX systems, you might type something like this:

```
mkdir plugin_excitingPlugin
```

- 2. If you need to include custom CSS or JS, add it to a file called custom_head.php in this new directory.
- 3. Create three PHP files in the directory: a JS file, a Srvr file, and a Forms file.

3.1.1 Create a plugin server

Your plugin's server — located at plugin_excitingPlugin/excitingSrvr.php — is responsible for three tasks:

- 1. Performing any actions the user requests.
- 2. Obtaining any relevant data from the database, file structure, or external API.
- 3. Displaying the relevant data to the user in a nice HTML format.

A basic plugin server consists of a require statement to get the necessary data and methods and a switch statement to take care of the $\PEQUEST['mode']$ variable. Here's a simple example:

If you would like to access data from the database, you should require the appropriate model from the model directory. For example, if you'd like to use the Biblios model, you would include this in your plugin_excitingPlugin/excitingSrvr.php:

```
require_once('../model/Biblios.php');
$bib = new Biblios;
```

You can then access all those great methods and data through the \$bib object.

3.2 Add your plugin to the OpenBiblio menu

1. Create a new directory inside the plugins directory with the name of your plugin. In UNIX systems, you might type something like this:

```
mkdir plugins/excitingPlugin
```

2. Create a file within this new directory called nav.nav

```
<?php
Nav::node('tools/excitingPlugin', 'Exciting Plugin', '../plugin_excitingPlugin/ ←
        excitingPluginForms.php');</pre>
```

3. If you'd like to use Obib's localization framework but need to localize some more terms, create a file called tran.tran. You can use this to add new terms to your locale.

Tip

Plugins already have all of the exciting localization ability built in. However, note that you cannot override localized term definitions within tran.tran.

- + WARNING: There is not yet a place to specify localized terms for plugins.
- 4. Turn on your plugin using Tools \rightarrow Plugin Manager.
